

## USING CHEMCAD ON AN APPLE

### COMPATIBILITY OF CHEMCAD 5.5.X AND LATER WITH APPLE OSX

#### INTEL – BASED APPLE COMPUTERS

Users have two options for running CHEMCAD on their computer:

- ✓ Users that install Apple Bootcamp to dualboot WinXPSP2 on their hardware may install and run CHEMCAD in the WinXP partition.
- ✓ Users that install Parallels desktop may run a virtual machine installation of Windows, while running OSX. CHEMCAD may be installed to the virtual machine in Parallels.

Either of these options requires use of a USB dongle, or network licensing.

We have successfully tested USB dongles on an Intel DualCore Mac Mini running XPSP2 in Bootcamp, and in Parallels.

#### NON-INTEL – BASED APPLE COMPUTERS

At this time we do not recommend using CHEMCAD on a non-Intel processor apple.
